

(J) ABSTRACT OF THE DISCLOSURE

The present invention is directed to a software based method and apparatus for managing all aspects of the tracking and dispatch industry, and in particular managing all aspects of a vehicle tow. The present invention allows a tower with a computer connection to
5 use the computer connection to access a database that is maintained by a third party.

Additionally, the system of the present invention integrates lien sale information with tow management information. The present invention is java based and utilizes click and drag features. Additionally, the software and system of the present invention allows for integration with other dispatching software packages.
